Biointelligent Sensor for Measuring Viral Activity

Today, genome editing is almost as easy as programming software. However, the generation of viral vectors as initial material is still associated with many expensive and error-prone handling procedures. Viruses are generated via complex biological processes that have to be optimised virus-specifically in order to produce high-quality therapeutics. A new method is needed that simplifies and optimises these processes.

Fraunhofer IPA is the overall coordinator of the European biointelligence project BioProS, which is funded with over 6 million euros as part of the HORIZON Europe programme. In this project, a biointelligent sensor for measuring viral activity for the production of therapeutics is being developed. The project started on 1 July 2022 and will run for 48 months.

The goal of BioProS is to optimise the production processes for therapeutic viruses through better quality control. A biohybrid sensor technology monitors cell-based virus infection cycles in real time. For this purpose, optical sensor technology is combined with cell-based measurement principles.

In the Fraunhofer IPA sub-project, among other things, a platform technology is being developed that can be adapted to several specific substances and virus types. This allows applying it in different industries and production environments. Since such a platform technology is complex, numerous European partners from different disciplines such as biology, engineering and mechanical engineering or computer science are involved.

Digitisation must span the entire manufacturing chain and utilise all the advances that have been made in intelligent personalised production in recent years.

The convergence of technical, informational, and biological systems are the basis of bio-intelligence. This new paradigm opens up a huge innovation space globally. Because Europe is at the forefront of manufacturing excellence, BioProS will make a significant contribution to sustainable and resilient manufacturing processes in the EU. Digital and bio-based process chains have the potential to revolutionise many industries and ensure their competitiveness.

Seven partners from five countries are represented in the BioProS consortium. Besides the Fraunhofer Society with their Institutes for Manufacturing Engineering and Automation IPA and for Interfacial Engineering and Biotechnology IGB in Stuttgart (Germany) these are Bico (Sweden), Necstgen (Netherlands), University Tübingen (Germany), Eura (Germany), Elvesys (France) and Politenico di Milano (Italy).

The consortium gathers all the necessary expertise under its roof and forms the basis for international partnerships. In close cooperation with other European initiatives and with the support of an industrial advisory board, the project partners want to realise the vision of biointelligent manufacturing and demonstrate the applicability of disruptive technologies in an industrial setting. This will foster research for biointelligent methods and global applications while guaranteeing technological sovereignty for Europe in the long term.

PRESS RELEASE

Viruses are generated using complex biomanufacturing procedures that require extensive quality control efforts to generate high quality preparations. A novel biohybrid sensor technology that monitors cell-based virus infection cycles in real time will be developed to realize highly efficient production processes with in-line quality control. It applies optical sensor technology in combination with cell-based measurement principles.

Fact sheet

Project: Biointelligent Production Sensor to Measure Viral Activity (BioProS)

Grantmaker: European Union

Funding amount: 6 317 693,50 Euro

Grant agreement No: 101070120

Coordinator: Fraunhofer-Gesellschaft zur Förderung der angewandten Forschung e. V.

Partners:

- Eberhard-Karls-Universität Tübingen
- Politecnico di Milano
- Bico Group AB
- Elvesys
- Netherlands Center for the Clinical Advancement of Stem Cell & Gene Therapies BV
- Eura AG

**Funded by
the European Union**

This project has received funding from the European Union's Horizon Europe research and innovation programme (HORIZON-CL4-2021-DIGITAL-EMERGING-01-27: Development of technologies/devices for bio-intelligent manufacturing (RIA)) under grant agreement No 101070120.

The **Fraunhofer-Gesellschaft**, headquartered in Germany, is the world's leading applied research organization. With its focus on developing key technologies that are vital for the future and enabling the commercial exploitation of this work by business and industry, Fraunhofer plays a central role in the innovation process. As a pioneer and catalyst for groundbreaking developments and scientific excellence, Fraunhofer helps shape society now and in the future. Founded in 1949, the Fraunhofer-Gesellschaft currently operates 75 institutes and research institutions throughout Germany. The majority of the organization's 29,000 employees are qualified scientists and engineers, who work with an annual research budget of 2.8 billion euros. Of this sum, 2.4 billion euros are generated through contract research.
